# Order-theoretic invariants in set-theoretic topology

David Milovich

May 12, 2009

# Van Douwen's Problem

Convention All spaces are Hausdorff  $(T_2)$ .

## Definition

- ► The cellularity c (X) of a space X is the least infinite upper bound of cardinalities of the pairwise disjoint family of open subsets of X.
- A space is homogeneous if for all p, q ∈ X, there is homeomorphism h: X → X such that h(p) = q.

## Theorem (Maurice)

 $2_{lex}^{\omega \cdot \omega}$  is a compact homogeneous space (CHS). Moreover, it has cellularity  $\mathfrak{c}$  where  $\mathfrak{c} = 2^{\aleph_0} = |\mathbb{R}|$ .

## Question (Van Douwen)

Is there a CHS with cellularity exceeding c?

# How do you make a CHS?

Definition

- A family B of open neighborhoods of a point p ∈ X is a local base at p if for every neighborhood U of p some B ∈ B satisfies B ⊆ U.
- The character χ(p, X) of p is the least infinite κ such that there is a local base of size at most κ at p.

• X is first countable if  $\chi(X) = \omega$ .

There is a zoo of examples of first countable CHS's (e.g.,  $2_{lex}^{\omega \cdot \omega}$ ). The other major class of CHS's is the class of compact groups (and compact loops, etc.). Any product of CHS's is a CHS.

Is there any other way to make a CHS? Van Mill found a way (via resolutions) that works (if  $\mathfrak{p} > \omega_1$ ). I found another way (via amalgams) that works (in ZFC).

# Calibers > cellularity

## Definition

- A family B of open subsets of X is a base of X if for all open U and p ∈ U, some B ∈ B satisfies p ∈ B ⊆ U.
- The weight w(X) of a space X is the least infinite κ such that X has a base of set of size at most κ.
- A regular uncountable cardinal κ is a **caliber** of a space X if for every sequence (U<sub>α</sub>)<sub>α<κ</sub> of open subsets of X, there is some I ∈ [κ]<sup>κ</sup> such that ⋂<sub>α∈I</sub> U<sub>α</sub> ≠ Ø.

## Basic facts

- If  $\kappa^+$  is a caliber of X, then  $c(X) \leq \kappa$ .
- Calibers are preserved by products and continuous images.
- If  $w(X) < \kappa$ , then  $\kappa$  is a caliber of X.
- If X is compact, then  $w(X) \leq |X|$ .

# Why is Van Douwen's Problem hard?

Theorem (Arhangel'skiĭ and Pospišil) If X is a CHS, then  $|X| = 2^{\chi(X)}$ .

# Theorem (Kuz'minov)

Every compact group is **dyadic**, i.e., a continuous image of a power of 2.

(Kunen noticed that by a result of Uspenskii, this theorem generalizes to compact loops, etc.)

Van Mill's and my "exceptional" CHS's all have weight at most c.

#### Observation

Every known CHS is a continuous image of a product of compacta each with weight at most  $\mathfrak{c}.$  Hence,  $\mathfrak{c}^+$  is a caliber of every known CHS. Hence, every known CHS has cellularity at most  $\mathfrak{c}.$ 

# Exceptional homogeneous compacta

## Definition

A CHS is **exceptional** if it is not homeomorphic to a product of first countable compacta and dyadic compacta.

Let T denote the unit circle. Van Mill's exceptional CHS is built using a clever topologization of  $2^{\omega} \times T^{\omega_1}$ . (Imagine each point in  $2^{\omega}$  being a tiny copy of  $T^{\omega_1}$ ...) Whether this space is homogeneous is independent of ZFC.

My exceptional CHS is a quotient space of  $T \times (2_{\mathsf{lex}}^{\omega \cdot \omega})^{\mathscr{S}}$ .

- Let  $\mathscr{S}$  denote the set of all open semicircle subsets of T.
- $\blacktriangleright \ \text{Given} \ \langle p,f\rangle, \langle q,g\rangle \in \mathcal{T} \times (2^{\omega \cdot \omega}_{\mathsf{lex}})^{\mathscr{S}} \text{, declare} \ \langle p,f\rangle \sim \langle q,g\rangle \ \text{if}$ 
  - p = q and
  - for all  $S \in \mathscr{S}$ , if  $p \in S$ , then f(S) = g(S).

How many bosses do you have?

## Convention

Families of subsets of a space are ordered by inclusion.

## Definition

A preordered set is  $\kappa^{\rm op}\text{-like}$  if no element has  $\kappa\text{-many}$  greater elements.

For example, the range of a descending sequence of sets  $\langle U_n \rangle_{n < \omega}$  is  $\omega^{\mathrm{op}}$ -like; the range of an ascending sequence of sets  $\langle V_n \rangle_{n < \omega}$  is  $\omega_1^{\mathrm{op}}$ -like, but not  $\omega^{\mathrm{op}}$ -like.

## Definition

- (Peregudov) The Noetherian type Nt (X) of a space X is the least infinite κ such that X has a κ<sup>op</sup>-like base.
- The local Noetherian type χNt (p, X) of p ∈ X is the least infinite κ such that X has a κ<sup>op</sup>-like local base at p.

# The metric case

#### Theorem

If X is metric space, then  $Nt(X) = \omega$ .

#### Proof

It suffices to build an  $\omega^{\text{op}}$ -like base of X. For each  $n < \omega$ , let  $\mathcal{U}_n$  be a locally finite refinement of the cover of X by all balls of radius  $2^{-n}$ . Then  $\bigcup_{n < \omega} \mathcal{U}_n$  is a  $\omega^{\text{op}}$ -like base of X.

#### Question

Does  $\omega^{\omega}$  (which is  $\cong \mathbb{R} \setminus \mathbb{Q}$ ) have a base that does not include an  $\omega^{\mathrm{op}}$ -like base? Does any space X have a base that does not include an  $\mathrm{Nt}(X)^{\mathrm{op}}$ -like base?

#### Partial Answer 1

No, if X is a  $\sigma$ -compact metric space.

Noetherian types and Van Douwen's Problem

## Theorem A

•  $\chi \operatorname{Nt}(p, X) \leq \chi(p, X)$  and  $\operatorname{Nt}(X) \leq w(X)^+$  always hold.

- If X is a continuous image of a product of compacta each with weight at most λ, then χNt (X) ≤ λ.
- If X is also homogeneous, then  $Nt(X) \leq \lambda^+$ .

## Observation

Every known CHS X satisfies  $\chi \operatorname{Nt} (X) = \omega$  and  $\operatorname{Nt} (X) \leq \mathfrak{c}^+$ . The double arrow space is a CHS with Noetherian type  $\mathfrak{c}^+$ .

Noetherian types and Van Douwen's Problem

## Theorem A

•  $\chi \operatorname{Nt}(p, X) \leq \chi(p, X)$  and  $\operatorname{Nt}(X) \leq w(X)^+$  always hold.

- If X is a continuous image of a product of compacta each with weight at most λ, then χNt (X) ≤ λ.
- If X is also homogeneous, then  $Nt(X) \leq \lambda^+$ .

## Observation

Every known CHS X satisfies  $\chi \operatorname{Nt} (X) = \omega$  and  $\operatorname{Nt} (X) \leq \mathfrak{c}^+$ . The double arrow space is a CHS with Noetherian type  $\mathfrak{c}^+$ .

# Theorem B (GCH)

Every CHS X satisfies  $\chi Nt(X) \leq c(X)$ .

Noetherian types and Van Douwen's Problem

## Theorem A

•  $\chi \operatorname{Nt}(p, X) \leq \chi(p, X)$  and  $\operatorname{Nt}(X) \leq w(X)^+$  always hold.

- ▶ If X is a continuous image of a product of compacta each with weight at most  $\lambda$ , then  $\chi \operatorname{Nt}(X) \leq \lambda$ .
- If X is also homogeneous, then  $Nt(X) < \lambda^+$ .

## Observation

Every known CHS X satisfies  $\chi Nt(X) = \omega$  and  $Nt(X) \leq \mathfrak{c}^+$ . The double arrow space is a CHS with Noetherian type  $\mathfrak{c}^+$ .

# Theorem B (GCH)

Every CHS X satisfies  $\chi \operatorname{Nt}(X) \leq c(X)$ .

There is (in ZFC) an inhomogeneous compactum X satisfying  $\chi \operatorname{Nt}(X) > c(X) = \omega.$ 

(Since every known CHS satisfies  $\chi Nt(X) = \omega$ , one wonders if GCH is necessary. This is an open problem.) くって 小山 くいく ふせく

# The Power homogeneous case

## Definition

- A space X is **power homogeneous** if X<sup>λ</sup> is homogeneous for some λ.
- The density d(X) of a space X is the least infinite κ for which X has a dense set of size at most κ. Note that c(X) ≤ d(X).

#### Question

Is  $\chi Nt(X) \leq c(X)$  true of every power homogeneous compactum X?  $\chi Nt(X) \leq d(X)$ ? Does assuming GCH affect the answer?

## Partial Answer (GCH) (joint with G. J. Ridderbos)

If X is a power homogeneous compactum and  $\max_{p \in X} \chi(p, X) = \operatorname{cf} \chi(X) > d(X)$ , then there is a nonempty open  $U \subseteq X$  such that  $\chi \operatorname{Nt}(p, X) = \omega$  for all  $p \in U$ .

# More bases

- A family B of nonempty open subsets of a space X is a π-base if for every nonempty open U ⊆ X, some B ∈ B satisfies B ⊆ U.
- The π-weight π(X) of X is the least infinite κ such that X has a π-base of size at most κ.
- The Noetherian π-type πNt (X) of X is the least infinite κ such that X has a κ<sup>op</sup>-like π-base.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# More bases

- A family B of nonempty open subsets of a space X is a π-base if for every nonempty open U ⊆ X, some B ∈ B satisfies B ⊆ U.
- The π-weight π(X) of X is the least infinite κ such that X has a π-base of size at most κ.
- The Noetherian π-type πNt (X) of X is the least infinite κ such that X has a κ<sup>op</sup>-like π-base.
- A family B of nonempty open sets is a local π-base at a point p ∈ X if for every neighborhood U of p, some B ∈ B satisfies B ⊆ U.
- The π-character πχ(p, X) of p is the least infinite κ such that there is a local π-base of size at most κ at p.
- The local Noetherian π-type πχNt (p, X) of a point p ∈ X is the least infinite κ such that there is a κ<sup>op</sup>-like local π-base at p.

$$\pi \chi(X) = \sup_{p \in X} \pi \chi(p, X); \ \pi \chi \operatorname{Nt}(X) = \sup_{p \in X} \pi \chi \operatorname{Nt}(p, X)$$

# More connections with Van Douwen's Problem

#### Theorem

If X is a continuous image of a product of compacta each with weight at most  $\lambda$ , then  $\pi \operatorname{Nt}(X) \leq \lambda$ .

#### Theorem

If X is compact, then  $\pi \operatorname{Nt}(X) \leq \chi(X)^+$ .

#### Observation

Every known CHS X satisfies  $\pi Nt(X) \leq \omega_1$  and  $\pi \chi Nt(X) = \omega$ .

# More connections with Van Douwen's Problem

#### Theorem

If X is a continuous image of a product of compacta each with weight at most  $\lambda$ , then  $\pi \operatorname{Nt}(X) \leq \lambda$ .

#### Theorem

If X is compact, then  $\pi \operatorname{Nt}(X) \leq \chi(X)^+$ .

#### Observation

Every known CHS X satisfies  $\pi \operatorname{Nt}(X) \leq \omega_1$  and  $\pi \chi \operatorname{Nt}(X) = \omega$ .

- ◊ implies there is a Suslin line that is a CHS. Every Suslin line L satisfies πNt (L) = ω<sub>1</sub>.
- ► It is not known if ZFC proves some CHS X satisfies  $\pi \operatorname{Nt} (X) > \omega$ .
- ► Worse, it is not known if any (Hausdorff) space X satisfies πχNt (X) > ω (in any model of ZFC).

# Tukey classes

# Definition (Tukey)

Given directed sets P and Q,  $P \leq_T Q$  means the following equivalent conditions hold.

- For some f: P → Q, the images of unbounded sets are unbounded.
- For some f: P → Q, the preimages of bounded sets are bounded.
- For some  $g: Q \rightarrow P$ , the images of cofinal sets are cofinal.

#### Theorem

If  $\mathcal{A}$  is a local base at  $p \in X$ ,  $h: X \to Y$  is a homeomorphism, and  $\mathcal{B}$  is a local base at h(p), then  $\langle \mathcal{A}, \supseteq \rangle \equiv_{\mathcal{T}} \langle \mathcal{B}, \supseteq \rangle$ .

#### Theorem

If  $\mathcal{A}$  is a local base at a non-isolated point  $p \in X$ , then  $\chi \operatorname{Nt}(p, X) \leq \lambda$  if and only if  $\langle \mathcal{A}, \supseteq \rangle \geq_{\mathcal{T}} \langle [\chi(p, X)]^{<\lambda}, \subseteq \rangle$ .

# Tukey classes and Van Douwen's Problem

## Theorem C

If X is compact and  $\lambda = \min_{q \in X} \pi \chi(q, X)$ , then some local base  $\mathcal{B}$  in X satisfies  $\langle \mathcal{B}, \supseteq \rangle \geq_{\mathcal{T}} \langle [\lambda]^{<\omega}, \subseteq \rangle$ .

#### Example

The space X = 2<sup>ω</sup> × 2<sup>ω1</sup><sub>lex</sub> × 2<sup>ω2</sup><sub>lex</sub> is such that χ(p, X) = ω<sub>2</sub> for all points p, πχ(p, X) = ω for some points p, and

$$\langle \mathcal{B}, \supseteq \rangle \equiv_{\mathcal{T}} \omega \times \omega_1 \times \omega_2 \not\geq_{\mathcal{T}} \big\langle [\omega_2]^{<\omega_1}, \subseteq \big\rangle$$

for all local bases  $\mathcal{B}$ . Hence,  $\chi Nt(p, X) = \omega_2$  for all  $p \in X$ .

## Tukey classes and Van Douwen's Problem

#### Theorem C

If X is compact and  $\lambda = \min_{q \in X} \pi \chi(q, X)$ , then some local base  $\mathcal{B}$  in X satisfies  $\langle \mathcal{B}, \supseteq \rangle \geq_T \langle [\lambda]^{<\omega}, \subseteq \rangle$ .

#### Example

► The space  $X = 2^{\omega} \times 2^{\omega_1}_{\text{lex}} \times 2^{\omega_2}_{\text{lex}}$  is such that  $\chi(p, X) = \omega_2$  for all points p,  $\pi\chi(p, X) = \omega$  for some points p, and

$$\langle \mathcal{B}, \supseteq \rangle \equiv_{\mathcal{T}} \omega \times \omega_1 \times \omega_2 \not\geq_{\mathcal{T}} \big\langle [\omega_2]^{<\omega_1}, \subseteq \big\rangle$$

for all local bases  $\mathcal{B}$ . Hence,  $\chi Nt(p, X) = \omega_2$  for all  $p \in X$ .

If some model of GCH has a CHS X with a local base B such that (B, ⊇) ≡<sub>T</sub> ω × ω<sub>1</sub> × ω<sub>2</sub>, then c (X) > c in this model.

# Tukey classes and Van Douwen's Problem

### Theorem C

If X is compact and  $\lambda = \min_{q \in X} \pi \chi(q, X)$ , then some local base  $\mathcal{B}$  in X satisfies  $\langle \mathcal{B}, \supseteq \rangle \geq_T \langle [\lambda]^{<\omega}, \subseteq \rangle$ .

#### Example

► The space  $X = 2^{\omega} \times 2^{\omega_1}_{\text{lex}} \times 2^{\omega_2}_{\text{lex}}$  is such that  $\chi(p, X) = \omega_2$  for all points p,  $\pi\chi(p, X) = \omega$  for some points p, and

$$\langle \mathcal{B}, \supseteq \rangle \equiv_{\mathcal{T}} \omega \times \omega_1 \times \omega_2 \not\geq_{\mathcal{T}} \big\langle [\omega_2]^{<\omega_1}, \subseteq \big\rangle$$

for all local bases  $\mathcal{B}$ . Hence,  $\chi Nt(p, X) = \omega_2$  for all  $p \in X$ .

- If some model of GCH has a CHS X with a local base B such that (B, ⊇) ≡<sub>T</sub> ω × ω<sub>1</sub> × ω<sub>2</sub>, then c (X) > c in this model.
- In every model of ZFC, we don't know if such a CHS exists, even if we replace ω × ω<sub>1</sub> × ω<sub>2</sub> with ω × ω<sub>1</sub> or ω × ω<sub>2</sub>.

# Subsets of bases

#### Question

Can a space X have a base that does not include an  $Nt(X)^{op}$ -like base?

#### Partial Answers

- **1.** No, if X is a  $\sigma$ -compact metric space.
- **2.** No, if X is a dyadic CHS.
- **3.** No, if X is a CHS and w(X) is regular. ("w(X) is regular" can be dropped if  $2^{\aleph_{\alpha}} < \aleph_{\alpha+\omega}$  for all  $\alpha$ .)

Answers 2 and 3 follow from the two theorems below.

If X is compact and \(\chi(p, X) = w(X)\) for all p ∈ X, then every base of X contains an Nt (X)<sup>op</sup>-like base of X.

If X is compact and πχ(p, X) < cf κ = κ ≤ w(X) for all p ∈ X, then Nt (X) > κ.

# Noetherian types of $\omega^{\ast}$

 $\omega^*$  is the space of nonprincipal ultrafilters on  $\omega.$  It is compact and inhomogeneous.

Theorem (Malykhin)

 $\mathsf{MA} \Rightarrow \pi \mathrm{Nt}(\omega^*) = \mathfrak{c} \text{ and } \mathsf{CH} \Rightarrow \mathrm{Nt}(\omega^*) = \mathfrak{c}.$ 

# Noetherian types of $\omega^*$

 $\omega^*$  is the space of nonprincipal ultrafilters on  $\omega.$  It is compact and inhomogeneous.

Theorem (Malykhin)

$$\mathsf{MA} \Rightarrow \pi \mathrm{Nt}(\omega^*) = \mathfrak{c} \text{ and } \mathsf{CH} \Rightarrow \mathrm{Nt}(\omega^*) = \mathfrak{c}.$$

## Definition

- Given  $R, S \subseteq \omega$ , we say S splits R if  $|R \cap S| = |R \setminus S| = \omega$ .
- The splitting number s is least size of a splitting family, which is a subset 𝒴 of [ω]<sup>ω</sup> such that every R ∈ [ω]<sup>ω</sup> is split by some S ∈ 𝒴.
- The reaping number τ is least size of a family R ⊆ [ω]<sup>ω</sup> such that no single S ⊆ ω splits every R ∈ R.
- The distributivity number h is the least κ such that forcing with ([ω]<sup>ω</sup>, ⊆\*) adds a new subset of κ.

Exercise:  $\mathfrak{c} \geq \mathfrak{r} \geq \mathfrak{h} \geq \omega_1 \leq \mathfrak{h} \leq \mathfrak{s} \leq \mathfrak{c}$ .

## A more precise theorem

ZFC proves each of the following statements.

$$\blacktriangleright \ \pi \mathrm{Nt} \left( \omega^* \right) = \mathfrak{h} \leq \mathfrak{s} \leq \mathrm{Nt} \left( \omega^* \right) \leq \mathfrak{c}^+.$$

• 
$$\chi \operatorname{Nt}(\omega^*) \leq \min \{\operatorname{Nt}(\omega^*), \mathfrak{c}\}.$$

$$\blacktriangleright \pi \chi \mathrm{Nt} (\omega^*) = \omega.$$

• 
$$MA \Rightarrow \pi \operatorname{Nt}(\omega^*) = \mathfrak{c} \Rightarrow \operatorname{Nt}(\omega^*) = \mathfrak{c}.$$

$$\mathbf{r} = \mathbf{c} \Rightarrow \operatorname{Nt}(\omega^*) \leq \mathbf{c}.$$

$$\blacktriangleright \ \mathfrak{r} < \mathfrak{c} \Rightarrow \operatorname{Nt}(\omega^*) \ge \mathfrak{c}.$$

• 
$$\mathfrak{r} < \mathsf{cf}\,\mathfrak{c} \Rightarrow \mathrm{Nt}\,(\omega^*) = \mathfrak{c}^+.$$

Each of the following statements are consistent with ZFC.

# A combinatorial version of Noetherian type

## Definition

- The supersplitting number ss<sub>2</sub> is the least κ such that there is a sequence (S<sub>α</sub>)<sub>α<c</sub> of subsets of ω such that {S<sub>α</sub> : α ∈ I} is a splitting family for all I ∈ [c]<sup>κ</sup>.
- The (other) supersplitting number ss<sub>ω</sub> is the least κ such that there is an n < ω and a sequence ⟨f<sub>α</sub>⟩<sub>α<c</sub> of maps from ω to n such that for all I ∈ [c]<sup>κ</sup> and all R ∈ [ω]<sup>ω</sup>, f<sub>α</sub> ↾ R is not eventually constant for some α ∈ I.

#### Theorem

 $\operatorname{Nt}(\omega^*) \leq \mathfrak{ss}_\omega \leq \mathfrak{ss}_2 \leq \mathfrak{c}^+.$ 

#### Question

Is  $Nt(\omega^*) < \mathfrak{ss}_2$  consistent? If  $\mathfrak{c}$  is regular, then  $Nt(\omega^*) = \mathfrak{ss}_{\omega}$ .

# Isbell's Problem

# Theorem (Isbell)

There is a nonprincipcal ultrafilter  $\mathcal{U}$  on  $\omega$  such that  $\langle \mathcal{U}, \supseteq^* \rangle \equiv_{\mathcal{T}} \langle \mathcal{U}, \supseteq \rangle \equiv_{\mathcal{T}} \langle [\mathfrak{c}]^{<\omega}, \subseteq \rangle.$ 

# Question 1 (Isbell's Problem)

Does ZFC prove there is a nonprincipal ultrafilter  $\mathcal{U}$  on  $\omega$  such that  $\langle \mathcal{U}, \supseteq \rangle \not\equiv_{\mathcal{T}} \langle [\mathfrak{c}]^{<\omega}, \subseteq \rangle$ ?

## Question 2

Does ZFC prove there is a nonprincipal ultrafilter  $\mathcal{U}$  on  $\omega$  such that  $\langle \mathcal{U}, \supseteq^* \rangle \not\equiv_T \langle [\mathfrak{c}]^{<\omega}, \subseteq \rangle$ ?

## Question 3 Does ZFC prove $\chi Nt(\omega^*) > \omega$ ?

## Theorem

 $\mathsf{Yes}_3 \Rightarrow \mathsf{Yes}_2 \Leftrightarrow \mathsf{Yes}_1.$ 

# Noetherian type and products

## Theorem

- (Peredudov)  $\operatorname{Nt} \left(\prod_{i \in I} X_i\right) \leq \sup_{i \in I} \operatorname{Nt} (X_i).$
- (Peregudov)  $\operatorname{Nt} (X^{w(X)}) = \omega$  for all spaces X.
- ▶ If  $w(\prod_{i \in I} X_i) \le |I|$  and  $|X_i| \ge 2$  for all  $i \in I$ , then  $Nt(\prod_{i \in I} X_i) = \omega$ .
- ► (Spadaro) There is a Tychonoff space Y such that Nt (ω<sub>1</sub> × Y) < Nt (ω<sub>1</sub>) = ω<sub>2</sub>.

#### Theorem

Suppose  $\alpha < \mathfrak{c}$  and  $\langle X_{\beta} \rangle_{\beta < \alpha}$  is a sequence of spaces each with weight at most  $\mathfrak{c}$ . Then  $\prod_{\beta < \alpha} (\omega^* \oplus X_{\beta})$  is not homeomorphic to a product of  $\mathfrak{c}$ -many nonsingleton spaces.

# Noetherian spectra

## Theorem

- {Nt (X) : X compact} = {infinite cardinals}.
- {Nt (X) : X compact linear order} =
   {infinite cardinals} \ ({ω<sub>1</sub>} ∪ {weak inaccessibles}).
- ▶  $\omega_1 \notin \{ \operatorname{Nt}(X) : X \text{ compact dyadic} \} \supseteq \\ \{ \omega \} \cup \{ \text{singular cardinals} \} \cup \{ \kappa^+ : \kappa = |\kappa| \text{ and } \operatorname{cf} \kappa > \omega \}.$

## Noetherian spectra

### Theorem

- {Nt (X) : X compact} = {infinite cardinals}.
- {Nt (X) : X compact linear order} = {infinite cardinals} \ ({ω₁} ∪ {weak inaccessibles}).
- ▶  $\omega_1 \notin \{ Nt(X) : X \text{ compact dyadic} \} \supseteq \\ \{ \omega \} \cup \{ \text{singular cardinals} \} \cup \{ \kappa^+ : \kappa = |\kappa| \text{ and } cf \kappa > \omega \}.$

• Nt 
$$(\kappa + 1) = \kappa^+$$
 if  $\kappa = \operatorname{cf} \kappa > \omega$ .

- $Nt(\kappa + 1) = \kappa$  if  $\kappa$  is a singular cardinal.
- If X is a compact linear order and Nt (X) ≤ κ = cf κ > ω, then d(X) < κ.</p>
- Let X = (2<sup>κ</sup> ⊕ 2<sup>λ</sup>)/ ~ where κ and λ are infinite cardinals and ~ identifies (0)<sub>α<κ</sub> and (0)<sub>α<λ</sub>. If κ < cf λ, then Nt (X) = λ<sup>+</sup>; if cf λ ≤ κ < λ, then Nt (X) = λ.</p>

These are a few of my favorite proofs...

## Special case of Theorem A If X is a dyadic CHS, then $Nt(X) = \omega$ .

**Proof ingredients** 

- ► Build an ω<sup>op</sup>-like base B = U<sub>α<w(X)</sub> B<sub>α</sub> by transfinite recursion of length w(X).
- Compact metric spaces have especially nice  $\omega^{op}$ -like bases.
- At stage α, carefully build a base A<sub>α</sub> of the metrizable quotient X/M<sub>α</sub> where points are distinguished iff they are separated by a continous real-valued function in M<sub>α</sub>, where |M<sub>α</sub>| = ω and M<sub>α</sub> ≺ H<sub>θ</sub> and θ is sufficiently large.

$$\blacktriangleright \mathcal{B}_{\alpha} = \{\bigcup A : A \in \mathcal{A}_{\alpha}\}.$$

# More ingredients

- 1. Construct  $\langle M_{\alpha} \rangle_{\alpha < w(X)}$  such that  $\langle M_{\beta} \rangle_{\beta < \alpha} \in M_{\alpha}$  for all  $\alpha$ .
- 2. Use homogeneity to prove  $\min_{p \in X} \pi \chi(p, X) = w(X)$ .  $(\pi \chi(Y) = w(Y)$  is true of all dyadic compact Y.)
- 3. Use (1) and (2) to choose a  $\mathcal{B}_{\alpha}$  that has no supersets of elements of  $\bigcup_{\beta < \alpha} \mathcal{B}_{\beta}$ .
- 4. Use (3) to show that for limit  $\delta$ ,  $\bigcup_{\beta < \delta} \mathcal{B}_{\beta}$  is  $\omega^{\text{op}}$ -like if  $\bigcup_{\beta < \alpha} \mathcal{B}_{\beta}$  is for all  $\alpha < \delta$ .
- 5. Deduce from (1) for each  $\alpha$ , there exists  $\alpha = \beta_0 > \cdots > \beta_n = 0$  such that for each i < n,  $N_i = \bigcup_{\beta_i > \gamma \ge \beta_{i+1}} M_{\gamma}$  satisfies  $M_{\alpha} \ni N_i \prec H_{\theta}$ .
- 6. Show that each quotient map from  $2^{w(X)}$  to  $2^{w(X)}/N_i$  is an open map.
- 7. Use (5) and (6) to show that  $\bigcup_{\beta < \alpha + 1} \mathcal{B}_{\beta}$  is  $\omega^{\text{op}}$ -like if  $\bigcup_{\beta < \alpha} \mathcal{B}_{\beta}$  is.

# A forcing construction

#### Theorem

Let  $\omega_1 \leq cf \ \kappa = \kappa \leq \lambda = \lambda^{<\kappa}$ . Then there is a ccc forcing extension in which

$$\pi \mathrm{Nt}\left(\omega^*
ight) = \chi \mathrm{Nt}\left(\omega^*
ight) = \mathrm{Nt}\left(\omega^*
ight) = \mathfrak{ss}_2 = \kappa \leq \lambda = \mathfrak{c}.$$

## **Proof ingredients**

- Construct a κ-like, κ-directed, well-founded poset Ξ with cofinality and cardinality λ.
- ► Construct a (generalized) forcing iteration along Ξ; let G be a generic filter.
- At each stage σ ∈ Ξ, add a Cohen real C<sub>σ</sub>, which will be Cohen generic over V[G ↾ (Ξ \ ↑σ)].
- Since  $\equiv$  is  $\kappa$ -like,  $\langle C_{\sigma} \rangle_{\sigma \in \Xi}$  witnesses  $\mathfrak{ss}_2 \leq \kappa$  in V[G].
- ► Since  $|\Xi| = \lambda = \lambda^{\omega}$ ,  $\langle C_{\sigma} \rangle_{\sigma \in \Xi}$  witnesses  $\mathfrak{c} = \lambda$  in V[G].

# More ingredients

- Using cf(Ξ) = λ = λ<sup><κ</sup>, κ-directedness of Ξ, and some bookkeeping, ensure that for each σ ∈ Ξ, every filter base in V[G ↾ (↓σ)] that has size less than κ has a pseudointersection in V[G].
- Deduce that every filter base in V[G] of size less than κ has a pseudointersection.
- Deduce that  $\pi \operatorname{Nt}(\omega^*) \geq \kappa$  in V[G].
- Extend the partial ordering of Ξ to a well ordering ⊑.
- ▶ Use  $\sqsubseteq$  to construct an ultrafilter  $\mathcal{U}$  in V[G] such that every  $\mathcal{V} \in [\mathcal{U}]^{<\kappa}$  has a pseudointersection in  $\mathcal{U}$ .

• Deduce that  $\chi \operatorname{Nt}(\omega^*) \geq \kappa$  in V[G].

How did GCH get in there?

Theorem B (GCH) Every CHS X satisfies  $\chi Nt(X) \le c(X)$ .

Proof ingedients

• (Arhangel'skiĭ and Pospišil)  $|Y| = 2^{\chi(Y)}$  for every CHS Y.

- (Arhangel'skii)  $|Y| \leq 2^{\pi \chi(Y)c(Y)}$  for every CHS Y.
- (GCH)  $\chi(X) \leq \pi \chi(X) c(X)$
- $\chi \operatorname{Nt}(Z) \pi \chi(Z) \leq \chi(Z)$  for every space Z.
- If  $\pi \chi(X) < \chi(X)$ , then  $\chi \operatorname{Nt}(X) \leq \chi(X) \leq c(X)$ .
- So, assume  $\pi \chi(X) = \chi(X)$ .
- The hard part is deducing  $\chi Nt(X) = \omega$ .

# The hard part

- By homogeneity, we only need to show that χNt (p, X) = ω for some p ∈ X.
- This is equivalent to showing that ⟨B,⊇⟩ ≥<sub>T</sub> ⟨[χ(p, X)]<sup><ω</sup>, ⊆⟩ for some local base B at some p ∈ X.

▶ By homogeneity,  $\pi\chi(p, X) = \chi(p, X) = \chi(X)$  for all  $p \in X$ .

**Theorem C.** If K is compact and  $\lambda = \min_{q \in K} \pi \chi(q, K)$ , then some local base  $\mathcal{B}$  in K satisfies  $\langle \mathcal{B}, \supseteq \rangle \geq_T \langle [\lambda]^{<\omega}, \subseteq \rangle$ .

# The hard part
