## Definition

A preorder P is κ-directed if every subset smaller than κ has an (upper) bound in P.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

**Directed** means  $\aleph_0$ -directed.

# Definition

- A preorder P is κ-directed if every subset smaller than κ has an (upper) bound in P.
- ▶ **Directed** means ℵ<sub>0</sub>-directed.

Conversely:

A preorder P is κ-short if every bounded subset is smaller than κ.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

▶ Flat means ℵ<sub>0</sub>-short.

## Definition

- A preorder P is κ-directed if every subset smaller than κ has an (upper) bound in P.
- **Directed** means  $\aleph_0$ -directed.

Conversely:

- A preorder P is κ-short if every bounded subset is smaller than κ.
- ▶ Flat means ℵ<sub>0</sub>-short.

#### Definition

A preorder *P* is **almost**  $\kappa$ -short if it has a  $\kappa$ -short cofinal suborder.

# Definition

- A preorder P is κ-directed if every subset smaller than κ has an (upper) bound in P.
- **Directed** means  $\aleph_0$ -directed.

Conversely:

- A preorder P is κ-short if every bounded subset is smaller than κ.
- ▶ Flat means ℵ<sub>0</sub>-short.

#### Definition

A preorder *P* is **almost**  $\kappa$ -short if it has a  $\kappa$ -short cofinal suborder.

#### Convention

Order sets like  $[\lambda]^{\kappa}$  and  $2^{<\kappa}$  by  $\subseteq$ .

# Classifying preorders

#### Definition

Two preorders P and Q are **mutually cofinal** if they are isomorphic to cofinal suborders of a common third preorder R.

# Lemma (M., 2005)

If P and Q are mutually cofinal and P is almost  $\kappa\text{-short},$  then Q is almost  $\kappa\text{-short}.$ 

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Classifying preorders

#### Definition

Two preorders P and Q are **mutually cofinal** if they are isomorphic to cofinal suborders of a common third preorder R.

# Lemma (M., 2005)

If P and Q are mutually cofinal and P is almost  $\kappa\text{-short},$  then Q is almost  $\kappa\text{-short}.$ 

#### Definition (Tukey, 1940)

▶ *P* is **Tukey-below** *Q*, or  $P \leq_T Q$ , if there exists  $f : P \leq_T Q$ , *i.e.*,  $f : P \rightarrow Q$  sends unbounded sets to unbounded sets.

 $\blacktriangleright P \equiv_T Q \text{ means } P \leq_T Q \leq_T P.$ 

# Classifying preorders

Two preorders P and Q are **mutually cofinal** if they are isomorphic to cofinal suborders of a common third preorder R.

# Lemma (M., 2005)

If P and Q are mutually cofinal and P is almost  $\kappa\text{-short},$  then Q is almost  $\kappa\text{-short}.$ 

### Definition (Tukey, 1940)

- ▶ *P* is **Tukey-below** *Q*, or  $P \leq_T Q$ , if there exists  $f : P \leq_T Q$ , *i.e.*,  $f : P \rightarrow Q$  sends unbounded sets to unbounded sets.
- $P \equiv_T Q$  means  $P \leq_T Q \leq_T P$ .

#### Tukey types aren't cofinal types...

 $2^{<\omega_1} \equiv_{\mathcal{T}} [\mathfrak{c}]^1$  and  $[\mathfrak{c}]^1$  is flat, but  $2^{<\omega_1}$  is not almost flat.

# ... until we assume directedness

Theorem (Tukey, 1940).

If P and Q are directed and  $P \equiv_T Q$ , then P and Q are mutually cofinal.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

# ... until we assume directedness

# Theorem (Tukey, 1940).

If P and Q are directed and  $P \equiv_T Q$ , then P and Q are mutually cofinal.

## Definition

A  $(\lambda, \kappa)$ -blossom in a preorder P is a map  $f : \lambda \to P$  such that f[I] is unbounded for all  $I \in [\lambda]^{\kappa}$ .

# ... until we assume directedness

### Theorem (Tukey, 1940).

If P and Q are directed and  $P \equiv_T Q$ , then P and Q are mutually cofinal.

### Definition

A  $(\lambda, \kappa)$ -blossom in a preorder P is a map  $f : \lambda \to P$  such that f[I] is unbounded for all  $I \in [\lambda]^{\kappa}$ .

# Theorem (M., 2007)

If P is directed and  $cf(P) \ge \aleph_0$ , then  $(1) \Rightarrow (2) \Leftrightarrow (3)$ :

- 1.  $[cf(P)]^{<\kappa} \leq_T P$ .
- 2. P has a  $(cf(P), \kappa)$ -blossom.
- 3. *P* is almost  $\kappa$ -short.
- If also  $\kappa = cf(\kappa)$  and  $|[cf(P)]^{<\kappa}| = cf(P)$ , then (1)  $\leftarrow$  (2).

- 1.  $[cf(P)]^{<\kappa} \leq_T P$ .
- 2. P has a  $(cf(P), \kappa)$ -blossom.
- 3. *P* is almost  $\kappa$ -short.

If also  $\kappa = cf(\kappa)$  and  $|[cf(P)]^{<\kappa}| = cf(P)$ , then  $(1) \Leftarrow (2)$ .

Proof

▶ (1) ⇒ (2): If 
$$f : [cf(P)]^{<\kappa} \leq_T P$$
, then  $\langle f(\{\alpha\}) \rangle_{\alpha < cf(P)}$  is a  $(cf(P), \kappa)$ -blossom.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Passing to subsets

### Applying mutual cofinality

- If B is a π-base of X, then B includes a πNt (X)-short π-base of X.
- If B is a local base at p in X, then B includes a χNt (X)-short local base at p in X.

### Theorem (M., 2007)

Every metrizable space has a flat base.

**Proof**: For each  $n < \omega$ , pick a locally finite open cover refining the balls of radius  $2^{-n}$ . Take the union.

# Passing to subsets

## Applying mutual cofinality

- If B is a π-base of X, then B includes a πNt (X)-short π-base of X.
- If B is a local base at p in X, then B includes a XNt (X)-short local base at p in X.

## Theorem (M., 2007)

Every metrizable space has a flat base.

**Proof**: For each  $n < \omega$ , pick a locally finite open cover refining the balls of radius  $2^{-n}$ . Take the union.

#### Example (M., 2009)

Set  $X = \mathbb{Z}^{\omega}$ . Let  $\mathcal{B}$  be the set of all sets of the form  $U_{s,n}$  where  $s \in \mathbb{Z}^{<\omega}$ ,  $n < \omega$ , and  $U_{s,n}$  is the set of all  $f \in X$  such that  $s^{\frown} i \subseteq f$  for some  $i \in [-n, n]$ .  $\mathcal{B}$  a base of X, but  $\mathcal{B}$  has no flat subcover.

# Blossoms and splitters

### Applying directedness

If  $p \in X$  is not isolated, then  $\chi \operatorname{Nt}(p, X) \leq \kappa$  if and only if  $\tau(p, X)$  has a  $(\chi(p, X), \kappa)$ -blossom, which is just a  $\chi(p, X)$ -sequence  $\vec{U}$  of neighborhoods of p such that  $p \notin \operatorname{int} \bigcap_{\alpha \in I} U_{\alpha}$  for all  $I \in [\chi(p, X)]^{\kappa}$ .

# Blossoms and splitters

### Applying directedness

If  $p \in X$  is not isolated, then  $\chi \operatorname{Nt}(p, X) \leq \kappa$  if and only if  $\tau(p, X)$  has a  $(\chi(p, X), \kappa)$ -blossom, which is just a  $\chi(p, X)$ -sequence  $\vec{U}$  of neighborhoods of p such that  $p \notin \operatorname{int} \bigcap_{\alpha \in I} U_{\alpha}$  for all  $I \in [\chi(p, X)]^{\kappa}$ .

#### Definition

A  $(\lambda, \kappa)$ -splitter of X is a  $\lambda$ -sequence  $\vec{\mathcal{F}}$  of finite open covers of X such that int  $\bigcap_{\alpha \in I} U_{\alpha} = \emptyset$  for all  $I \in [\chi(p, X)]^{\kappa}$  and  $\vec{U} \in \prod_{\alpha \in I} \mathcal{F}_{\alpha}$ .

# Blossoms and splitters

## Applying directedness

If  $p \in X$  is not isolated, then  $\chi \operatorname{Nt}(p, X) \leq \kappa$  if and only if  $\tau(p, X)$  has a  $(\chi(p, X), \kappa)$ -blossom, which is just a  $\chi(p, X)$ -sequence  $\vec{U}$  of neighborhoods of p such that  $p \notin \operatorname{int} \bigcap_{\alpha \in I} U_{\alpha}$  for all  $I \in [\chi(p, X)]^{\kappa}$ .

### Definition

A  $(\lambda, \kappa)$ -splitter of X is a  $\lambda$ -sequence  $\vec{\mathcal{F}}$  of finite open covers of X such that int  $\bigcap_{\alpha \in I} U_{\alpha} = \emptyset$  for all  $I \in [\chi(p, X)]^{\kappa}$  and  $\vec{U} \in \prod_{\alpha \in I} \mathcal{F}_{\alpha}$ .

#### Lemma

If X has a  $(w(X), \kappa)$ -splitter, then  $Nt(X) \leq \kappa$ .

### Question (M., 2007)

Does Nt  $(\beta \omega \setminus \omega) \leq \kappa$  imply  $\beta \omega \setminus \omega$  has a  $(\mathfrak{c}, \kappa)$ -splitter in ZFC? (There can be no counterexamples if  $\mathfrak{c}$  is regular.)

Easy applications of blossoms and splitters

# Theorem If $X = \prod_{\alpha < \kappa} X_{\alpha}$ and $|X_{\alpha}| > 1$ for all $\alpha < \kappa$ , then $\blacktriangleright \kappa \ge \chi(p, X) \Rightarrow \chi \operatorname{Nt}(p, X) = \aleph_0;$ $\flat \kappa \ge \chi(X) \Rightarrow \chi \operatorname{Nt}(X) = \aleph_0;$ $\flat \kappa \ge \pi(X) \Rightarrow \pi \operatorname{Nt}(X) = \aleph_0;$ $\flat \kappa \ge w(X) \Rightarrow \operatorname{Nt}(X) = \aleph_0.$

Easy applications of blossoms and splitters

# Theorem If $X = \prod_{\alpha < \kappa} X_{\alpha}$ and $|X_{\alpha}| > 1$ for all $\alpha < \kappa$ , then $\kappa \ge \chi(p, X) \Rightarrow \chi \operatorname{Nt}(p, X) = \aleph_0;$ $\kappa \ge \chi(X) \Rightarrow \chi \operatorname{Nt}(X) = \aleph_0;$ $\kappa \ge \pi(X) \Rightarrow \pi \operatorname{Nt}(X) = \aleph_0;$ $\kappa \ge w(X) \Rightarrow \operatorname{Nt}(X) = \aleph_0.$

### Proof (essentially (Malykhin, 1981))

First claim: For each  $\alpha < \chi(p, X)$ , choose a nontrivial open neighborhood  $U_{\alpha}$  of  $p(\alpha)$ . Since all open boxes in the product topology have finite support,  $\langle \pi_{\alpha}^{-1}[U_{\alpha}] \rangle_{\alpha < \kappa}$  is a  $(\chi(p, X), \aleph_0)$ -blossom for  $\tau(p, X)$ .

### Corollary

• 
$$\operatorname{Nt}(X \times 2^{w(X)}) = \aleph_0$$
. (Malykhin, 1981)

# Passing to subsets again

#### Definition

A space X is **homogeneous** if for all  $p, q \in X$ , there is a bijection  $f: X \to X$  with f(p) = q and f and  $f^{-1}$  continuous.

### Theorem (M., 2009)

Let  $\mathcal{B}$  be a base of X.  $\mathcal{B}$  includes an Nt(X)-short base of X if

- X is metrizable and X is locally compact or  $\sigma$ -compact,
- X is compact and  $\chi(p, X) = w(X)$  for all  $p \in X$ , or
- ➤ X is compact, homogeneous, and w(X) is regular or strong limit.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <
## Passing to subsets again

#### Definition

A space X is **homogeneous** if for all  $p, q \in X$ , there is a bijection  $f: X \to X$  with f(p) = q and f and  $f^{-1}$  continuous.

#### Theorem (M., 2009)

Let  $\mathcal{B}$  be a base of X.  $\mathcal{B}$  includes an Nt(X)-short base of X if

- X is metrizable and X is locally compact or  $\sigma$ -compact,
- X is compact and  $\chi(p,X) = w(X)$  for all  $p \in X$ , or
- ➤ X is compact, homogeneous, and w(X) is regular or strong limit.

#### About the proof

- For the second case, we build a (w(X), κ)-splitter consisting of subcovers of an arbitrary base.
- For the third case, we use Misčenko's Lemma to deduce that the second case holds or Nt (X) = w(X)<sup>+</sup>.

#### Definition

The **cellularity** c(X) of X is the least infinite upper bound of the cardinalities of its **cellular families**, *i.e.*, pairwise disjoint open families.

#### Patterns

- Every known compact homogeneous space (CHS) is a continuous image of a product of compacta with weight at most c.
- It follows that every known CHS has cellularity at most c. (Why? Easy: c<sup>+</sup> is a caliber of any such space.)
- Van Douwen's Problem asks whether c (X) ≤ c for every CHS X. This is open after ~40 years, in all models of ZFC.

#### Definition

The **cellularity** c(X) of X is the least infinite upper bound of the cardinalities of its **cellular families**, *i.e.*, pairwise disjoint open families.

#### Patterns

- Every known compact homogeneous space (CHS) is a continuous image of a product of compacta with weight at most c.
- It follows that every known CHS has cellularity at most c. (Why? Easy: c<sup>+</sup> is a caliber of any such space.)
- Van Douwen's Problem asks whether c (X) ≤ c for every CHS X. This is open after ~40 years, in all models of ZFC.
- It also follows that every known CHS has Noetherian type at most c<sup>+</sup>. (Why? Not as easy...)

# Sharp bounds

#### Example (Maurice, 1964)

The lexicographically ordered space  $X = 2_{lex}^{\omega \cdot \omega}$  is a CHS satisfying  $c(X) = \mathfrak{c}$ .

## Example (Peregudov, 1997)

The double-arrow space X is compact, homogeneous, and  $Nt(X) = \mathfrak{c}^+$ .

## Theorem (M., 2007)

If X is CHS and a continuous image of a product of compacta all with weight at most  $\lambda$ , then  $Nt(X) \leq \lambda^+$ . If also  $\lambda = \aleph_0$  (*i.e.*, X is **dyadic**), then  $Nt(X) = \aleph_0$ .

- $X = 2_{\text{lex}}^{\omega} \times 2_{\text{lex}}^{\omega_1} \times 2_{\text{lex}}^{\omega_2}$  is compact, and  $\mathcal{B} \equiv_{\mathcal{T}} \omega \times \omega_1 \times \omega_2$  for all local bases B, but X is not homogeneous.
- (Arhangel'skiĭ, 2005) If a product of linear orders is a CHS, then all factors are first countable, and hence have weight at most c.

Assuming GCH,  $\chi Nt(X) \leq c(X)$  if X is a CHS.

Proof

Lemma (M. 2007). If X is compact and πχ(p, X) ≥ κ for all p ∈ X, then τ(q, X) has (κ, ℵ₀)-blossom for some q ∈ X.

Assuming GCH,  $\chi Nt(X) \leq c(X)$  if X is a CHS.

Proof

- Lemma (M. 2007). If X is compact and πχ(p, X) ≥ κ for all p ∈ X, then τ(q, X) has (κ, ℵ₀)-blossom for some q ∈ X.
- ► Hence, if X is compact and πχ(p, X) = χ(X) for all p ∈ X, then X has a flat local base.

Assuming GCH,  $\chi Nt(X) \leq c(X)$  if X is a CHS.

Proof

- Lemma (M. 2007). If X is compact and πχ(p, X) ≥ κ for all p ∈ X, then τ(q, X) has (κ, ℵ₀)-blossom for some q ∈ X.
- ► Hence, if X is compact and πχ(p, X) = χ(X) for all p ∈ X, then X has a flat local base.

• Therefore, given a CHS X, we have  $\chi \operatorname{Nt} (X) = \aleph_0$  or  $\pi \chi(X) < \chi(X)$ .

Assuming GCH,  $\chi Nt(X) \leq c(X)$  if X is a CHS.

Proof

- Lemma (M. 2007). If X is compact and πχ(p, X) ≥ κ for all p ∈ X, then τ(q, X) has (κ, ℵ₀)-blossom for some q ∈ X.
- Hence, if X is compact and πχ(p, X) = χ(X) for all p ∈ X, then X has a flat local base.

- Therefore, given a CHS X, we have  $\chi \operatorname{Nt} (X) = \aleph_0$  or  $\pi \chi(X) < \chi(X)$ .
- (Arhangel'skiĭ, Ismail) If Y is a CHS, then  $2^{\chi(Y)} \le |Y| \le 2^{\pi\chi(Y)c(Y)}$ .

Assuming GCH,  $\chi Nt(X) \leq c(X)$  if X is a CHS.

Proof

- Lemma (M. 2007). If X is compact and πχ(p, X) ≥ κ for all p ∈ X, then τ(q, X) has (κ, ℵ₀)-blossom for some q ∈ X.
- Hence, if X is compact and πχ(p, X) = χ(X) for all p ∈ X, then X has a flat local base.

- Therefore, given a CHS X, we have  $\chi \operatorname{Nt} (X) = \aleph_0$  or  $\pi \chi(X) < \chi(X)$ .
- (Arhangel'skiĭ, Ismail) If Y is a CHS, then  $2^{\chi(Y)} \leq |Y| \leq 2^{\pi\chi(Y)c(Y)}$ .
- ► So, assuming GCH,  $\pi \chi(X) < \chi(X)$  implies  $\chi \operatorname{Nt}(X) \leq \chi(X) \leq c(X)$ .

▶ Perhaps an easier question: Does GCH imply  $\chi$ Nt (X) ≤ c (X) for all PHC X?
### Definition

d(X) is the least  $\kappa \geq \aleph_0$  such that some  $D \in [X]^{\leq \kappa}$  is dense in X.

#### Perhaps an even easier question:

Does GCH imply  $\chi Nt(X) \leq d(X)$  for all PHC X?

## Theorem (M., Ridderbos, 2007)

Given GCH, X PHC, and  $\max_{p \in X} \chi(p, X) = cf(\chi(X)) > d(X)$ , there is a nonempty open  $U \subseteq X$  such that  $\chi Nt(p, X) = \aleph_0$  for all  $p \in U$ .

Sometimes compactness doesn't matter.

(M., 2009) If  $p \in X$  and  $\overline{X} = Y$ , e.g.,  $Y = \beta X$ , then  $\chi \operatorname{Nt}(p, X) = \chi \operatorname{Nt}(p, Y)$  and  $\pi \operatorname{Nt}(X) = \pi \operatorname{Nt}(Y)$ . On the other hand,  $\operatorname{Nt}(\mathbb{N}) = \aleph_0$  and  $\operatorname{Nt}(\beta \mathbb{N}) = \mathfrak{c}^+$ .

#### Sometimes compactness doesn't matter.

(M., 2009) If  $p \in X$  and  $\overline{X} = Y$ , e.g.,  $Y = \beta X$ , then  $\chi \operatorname{Nt}(p, X) = \chi \operatorname{Nt}(p, Y)$  and  $\pi \operatorname{Nt}(X) = \pi \operatorname{Nt}(Y)$ . On the other hand,  $\operatorname{Nt}(\mathbb{N}) = \aleph_0$  and  $\operatorname{Nt}(\beta \mathbb{N}) = \mathfrak{c}^+$ .

Product spaces can surprise you.

- (Todorčević, 1985) If cf(κ) = κ = κ<sup>ℵ0</sup>, then there exist directed P, Q with P, Q <<sub>T</sub> P × Q ≡<sub>T</sub> [κ]<sup><ℵ0</sup>.
- ▶ (M., 2010) Using these P and Q, we can build X, Y such that  $\chi \operatorname{Nt} (X) = \chi \operatorname{Nt} (Y) = \aleph_1$  and  $\chi \operatorname{Nt} (X \times Y) = \aleph_0$ .

#### Sometimes compactness doesn't matter.

$$\operatorname{split}_{\chi(\rho,X)}(\rho,X) = \chi \operatorname{Nt}(\rho,X).$$

- $\chi(p, X) < \operatorname{cf} \lambda \Rightarrow \operatorname{split}_{\lambda}(p, X) = \lambda^+.$
- ► For all singular cardinals  $\lambda$ , split<sub> $\lambda$ </sub>(p, X)  $\leq$  (sup<sub> $\mu < \lambda$ </sub> split<sub> $\mu$ </sub>(p, X))<sup>+</sup>.
- ▶ If cf  $\lambda \leq \kappa < \lambda$ , then  $\operatorname{split}_{\lambda}(p^{\kappa}, X^{\kappa}) = \sup_{\mu < \lambda} \operatorname{split}_{\mu}(p, X)$ .

What about regular limit cardinals?

### Definițion

Let  $\prod_{i \in I}^{(\kappa)} X_i$  denote the set  $\prod_{i \in I} X_i$  with the topology generated by products of open sets with support smaller than  $\kappa$ .

# What about regular limit cardinals?

### Definițion

Let  $\prod_{i \in I}^{(\kappa)} X_i$  denote the set  $\prod_{i \in I} X_i$  with the topology generated by products of open sets with support smaller than  $\kappa$ .

### Example (M., 2009)

- If p ∈ X = Π<sup>(λ)</sup><sub>α<λ</sub> 2<sup>α</sup> and λ is strongly inaccessible, then split<sub>μ</sub>(p, X) = ℵ<sub>0</sub> for all μ < λ, but split<sub>λ</sub>(p, X) = χNt (p, X) = λ.
- The proof's essential ingredient runs short an elementary-submodel proof of the Erdös-Rado Theorem.

(日) (同) (三) (三) (三) (○) (○)

Example (M., 2009)

• Let 
$$p \in X = \prod_{\alpha < \omega_1}^{(\aleph_1)} \prod_{\beta < \beth_\alpha}^{(\aleph_\omega)} 2.$$

## Example (M., 2009)

### Example (M., 2009)

- Let  $p \in X = \prod_{\alpha < \omega_1}^{(\aleph_1)} \prod_{\beta < \beth_{\alpha}}^{(\aleph_{\omega})} 2.$
- ▶ We then have  $\chi(p, X) = \beth_{\omega_1}$ ,  $\chi \operatorname{Nt}(p, X) = \operatorname{split}_{\beth_{\omega_1}}(p, X) = \aleph_{\omega}^+$ , and  $\chi \operatorname{Nt}(p^{\omega_1}, X^{\omega_1}) = \sup_{\mu < \beth_{\omega_1}} \operatorname{split}_{\mu}(p, X) = \aleph_{\omega}$ .
- The key lemma for the proof is that the set of countably supported maps from ω₁ to ω (with the product ordering) does not have an (ω₁, ℵ₀)-blossom.

#### Example (M., 2009)

• Let 
$$p \in X = \prod_{\alpha < \omega_1}^{(\aleph_1)} \prod_{\beta < \beth_\alpha}^{(\aleph_\omega)} 2.$$

- ▶ We then have  $\chi(p, X) = \beth_{\omega_1}$ ,  $\chi \operatorname{Nt}(p, X) = \operatorname{split}_{\beth_{\omega_1}}(p, X) = \aleph_{\omega}^+$ , and  $\chi \operatorname{Nt}(p^{\omega_1}, X^{\omega_1}) = \sup_{\mu < \beth_{\omega_1}} \operatorname{split}_{\mu}(p, X) = \aleph_{\omega}$ .
- The key lemma for the proof is that the set of countably supported maps from ω₁ to ω (with the product ordering) does not have an (ω₁, ℵ₀)-blossom.
- Why? If F: ω<sub>1</sub> → Fn(ω<sub>1</sub>, ω, ℵ<sub>1</sub>), F ∈ M ≺ H(ℵ<sub>2</sub>), and |M| = ℵ<sub>0</sub>, then we can use reflect properties of F(ω<sub>1</sub> ∩ M) to find infinitely many F(α) ∈ M all dominated by a single g ∈ Fn(ω<sub>1</sub>, ω, ℵ<sub>1</sub>).

► Let 
$$p \in X = \prod_{\alpha < \aleph_{\omega}}^{(\aleph_1)} 2$$
. We then have  $\chi(p, X) = \pi(X) = w(X) = \aleph_{\omega}^{\aleph_0}$ .

▶ Let 
$$p \in X = \prod_{\alpha < \aleph_{\omega}}^{(\aleph_1)}$$
 2. We then have  $\chi(p, X) = \pi(X) = w(X) = \aleph_{\omega}^{\aleph_0}$ .

ℵ<sub>1</sub> ≤ Nt (X) ≤ c<sup>+</sup>. Moreover, c ≤ ℵ<sub>ω+1</sub> ⇒ Nt (X) ≤ ℵ<sub>ω+1</sub>.
Open: can we have Nt (X) > ℵ<sub>ω+1</sub>?

▶ Let 
$$p \in X = \prod_{\alpha < \aleph_{\omega}}^{(\aleph_1)}$$
 2. We then have  $\chi(p, X) = \pi(X) = w(X) = \aleph_{\omega}^{\aleph_0}$ .

▶  $\aleph_1 \leq \operatorname{Nt}(X) \leq \mathfrak{c}^+$ . Moreover,  $\mathfrak{c} \leq \aleph_{\omega+1} \Rightarrow \operatorname{Nt}(X) \leq \aleph_{\omega+1}$ . Open: can we have  $\operatorname{Nt}(X) > \aleph_{\omega+1}$ ?

▶ Let 
$$p \in X = \prod_{\alpha < \aleph_{\omega}}^{(\aleph_1)} 2$$
. We then have  $\chi(p, X) = \pi(X) = w(X) = \aleph_{\omega}^{\aleph_0}$ .

▶  $\aleph_1 \leq \operatorname{Nt}(X) \leq \mathfrak{c}^+$ . Moreover,  $\mathfrak{c} \leq \aleph_{\omega+1} \Rightarrow \operatorname{Nt}(X) \leq \aleph_{\omega+1}$ . Open: can we have  $\operatorname{Nt}(X) > \aleph_{\omega+1}$ ?

- If □<sub>ℵω</sub> and ℵ<sup>ℵ₀</sup><sub>ω</sub> = ℵ<sub>ω+1</sub>, then Nt (X) = πNt (X) = χNt (p, X) = ℵ<sub>1</sub>. (Why? We can use Bernstein sets and a locally countable S ⊆ [ℵ<sub>ω</sub>]<sup>ℵ₀</sup> of size ℵ<sub>ω+1</sub> to build an ℵ<sub>1</sub>-short base...)
- (Soukup)

 $(\aleph_{\omega+1}, \aleph_{\omega}) \twoheadrightarrow (\aleph_1, \aleph_0) \Rightarrow \operatorname{Nt}(X) \ge \chi \operatorname{Nt}(\rho, X) \ge \aleph_2$ . (The hypothesis is consistent relative (roughly) to a huge cardinal (Levinski, Magidor, Shelah, 1990).)

▶ Let 
$$p \in X = \prod_{\alpha < \aleph_{\omega}}^{(\aleph_1)} 2$$
. We then have  $\chi(p, X) = \pi(X) = w(X) = \aleph_{\omega}^{\aleph_0}$ .

▶  $\aleph_1 \leq \operatorname{Nt}(X) \leq \mathfrak{c}^+$ . Moreover,  $\mathfrak{c} \leq \aleph_{\omega+1} \Rightarrow \operatorname{Nt}(X) \leq \aleph_{\omega+1}$ . Open: can we have  $\operatorname{Nt}(X) > \aleph_{\omega+1}$ ?

- If □<sub>ℵω</sub> and ℵ<sup>ℵ₀</sup><sub>ω</sub> = ℵ<sub>ω+1</sub>, then Nt (X) = πNt (X) = χNt (p, X) = ℵ<sub>1</sub>. (Why? We can use Bernstein sets and a locally countable S ⊆ [ℵ<sub>ω</sub>]<sup>ℵ₀</sup> of size ℵ<sub>ω+1</sub> to build an ℵ<sub>1</sub>-short base...)
- (Soukup)

 $(\aleph_{\omega+1}, \aleph_{\omega}) \rightarrow (\aleph_1, \aleph_0) \Rightarrow \operatorname{Nt}(X) \ge \chi \operatorname{Nt}(p, X) \ge \aleph_2$ . (The hypothesis is consistent relative (roughly) to a huge cardinal (Levinski, Magidor, Shelah, 1990).)

▶ Open: Can we have  $\pi Nt(X) > \aleph_1$ ? Equivalently, can  $\langle Fn(\aleph_{\omega}, 2, \aleph_1), \subseteq \rangle$  fail to be almost  $\aleph_1$ -short?

## Noetherian spectra

#### Another application of Bernstein sets (M., 2009)

If  $c \ge \kappa$  and  $\kappa$  is weakly inacessible, then there is a Lindelöf linear order with Noetherian type  $\kappa$ ..

### Excluded Noetherian types (M., 2008)

► The compact linear orders attain all Noetherian types except ℵ<sub>1</sub> and weak inaccessibles.

- ▶ Open: Does CH imply there exist  $U, V \in \beta \omega \setminus \omega$  such that  $U_* \not\leq_T V_* \not\leq_T U_*$ ?

# The (local) Noetherian ( $\pi$ -)type of $\beta \omega \setminus \omega$

ZFC proves each of the following statements.

• 
$$\pi \operatorname{Nt} (\beta \omega \setminus \omega) = \mathfrak{h} \leq \mathfrak{s} \leq \operatorname{Nt} (\beta \omega \setminus \omega) \leq \mathfrak{c}^+.$$

• 
$$\chi \operatorname{Nt} (\beta \omega \setminus \omega) \leq \min \{ \operatorname{Nt} (\beta \omega \setminus \omega), \mathfrak{c} \}.$$

• 
$$MA \Rightarrow \pi \operatorname{Nt} (\beta \omega \setminus \omega) = \mathfrak{c} \Rightarrow \operatorname{Nt} (\beta \omega \setminus \omega) = \mathfrak{c}.$$

$$\blacktriangleright \ \mathfrak{r} = \mathfrak{c} \Rightarrow \operatorname{Nt} \left( \beta \omega \setminus \omega \right) \leq \mathfrak{c}.$$

$$\mathfrak{r} < \mathfrak{c} \Rightarrow \operatorname{Nt} (\beta \omega \setminus \omega) \geq \mathfrak{c}.$$

• 
$$\mathfrak{r} < \mathsf{cf} \,\mathfrak{c} \Rightarrow \mathrm{Nt} \,(\beta \omega \setminus \omega) = \mathfrak{c}^+.$$

Each of the following statements is consistent with ZFC.

$$\begin{aligned} & \omega_1 = \pi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) = \chi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) = \operatorname{Nt} \left( \beta \omega \setminus \omega \right) < \mathfrak{c}. \\ & \omega_1 < \pi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) = \chi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) = \operatorname{Nt} \left( \beta \omega \setminus \omega \right) < \mathfrak{c}. \\ & \omega_1 = \pi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) < \operatorname{Nt} \left( \beta \omega \setminus \omega \right) < \mathfrak{c}. \\ & \omega_1 < \pi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) < \chi \operatorname{Nt} \left( \beta \omega \setminus \omega \right) = \mathfrak{c} < \operatorname{Nt} \left( \beta \omega \setminus \omega \right). \end{aligned}$$
