1.	0 half lives	10,000 atoms
	1 half lives	5,000 atoms
	2 half lives	2,500 atoms
	3 half lives	1,250 atoms

2. 0.4 Half Lives; $0.4 \text{ half lives} \times 5730 \text{ years} = 2292 \text{ years}$
3. 1.4 half lives; $1.4 \text{ half lives} \times 713 \text{ million years} = 998 \text{ million years}$
4. No, with its short half life, there would be no carbon-14 left to measure
5. No, with its long half live virtually no uranium 238 would decay to lead
6. 1.3 to 1.4 Half Lives or 927 to 998 Ma
